Exp no:9. Real Estate Data Analysis

Aim: To analyze property prices, bedrooms, and areas.

Algorithm:

1. Import Pandas.
2. Calculate average price by location.
3. Count properties with more than four bedrooms.
4. Find the property with the largest area.

Code:

```
import pandas as pd

data = pd.DataFrame({

    'location': ['Chennai', 'Madurai', 'Chennai'],

    'bedrooms': [3, 5, 2],

    'area': [1200, 2000, 900],

    'price': [5000000, 7000000, 4000000]

})

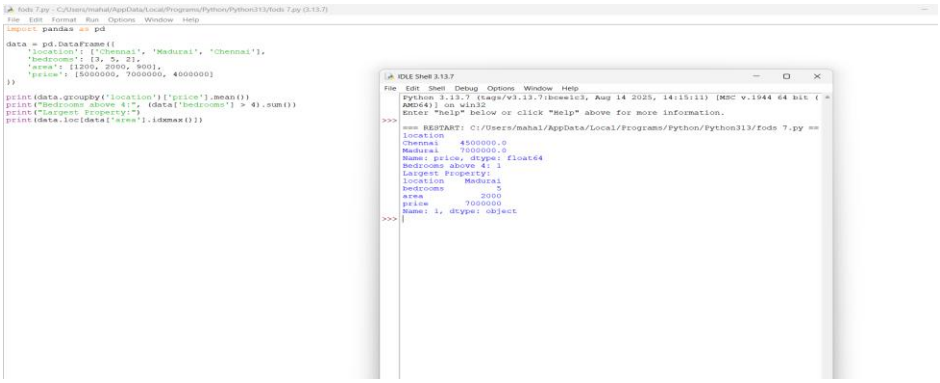

print(data.groupby('location')['price'].mean())

print("Bedrooms above 4:", (data['bedrooms'] > 4).sum())

print("Largest Property:")

print(data.loc[data['area'].idxmax()])
```

Output:

Result:

Customer orders and product quantities were analyzed successfully.
